

AI that remembers so you don't have to.

## **ReMemora is like a smart memory for your codebase.**

It scans past projects, finds useful building blocks, and makes them searchable by what they do - not just by file name or keywords.

Instead of starting from scratch, you can just ask:

*"Do we already have code that does this?"* and get an answer.

## **What makes ReMemora different?**

Most AI coding tools help you write new code or explain code you're already looking at. ReMemora helps you rediscover and reuse existing work - even if it's buried in a project from a year ago or written by someone else.

***ReMemora: Rediscover what you already built.***
